F I S H E S

Fisher's Fishes is a virtual, student-led community of budding quantitative biologists.

In the absence of a formal curriculum and guidance on how to start in this interdisciplinary field, we help each other learn by hosting a curated mix of talks by faculty and peers. We simultaneously function as a platform where people can present things that spark their curiosity, whether that's a paper they wrote, their master's thesis project, or just a paper they're interested in and want to dig into with others.

Our primarily online format lets us put a diverse set of people in the same (zoom) room without significant resources. Over about two and a half years we've held around 30 talks on a wide range of topics, from ecology and evolution to biophysics, mathematical oncology, and even the history of science.

A subset of these talks goes up on our YouTube channel with the speaker's consent, but the website carries much more. We publish the speaker's slides after talks, often with reading lists put together by the speakers themselves, which helps people cut the clutter and learn the absolute basics needed to understand a talk.

We keep a detailed database of eco-evo labs and a running list of internship opportunities. We also present the somewhat non-linear paths that are common in our field, by interviewing established researchers, so that the community can understand what a career in the field looks like.

We are passionate about expanding access to quantitative biology in the Global South, where the support for this exciting, interdisciplinary field is thinnest. Departments tend to be siloed, funding and mentorship follow established disciplines, and there are rarely enough peers nearby working on the same questions to reach a critical mass. But some of it is simpler than that. A lot of people never find out that quantitative biology is a path open to them at all, and that lack of awareness is something we can take on directly. Anyone who wants to foster a community like this in their own university or region is welcome to join us, and as more and more people connect we shall form a network offering many invaluable perspectives.

If this initiative excites you, please reach out to us! Here is where you can find us :
